## 1 IMPORTANT RECEIVING INSTRUCTIONS

Visually inspect all components for shipping damage. Shipping damage is not covered by warranty. If shipping damage is found notify carrier at once. The carrier is responsible for all repair and replacement costs resulting from damage in shipment.

## SAFETY FIRST

Read all INSTRUCTIONS, WARNINGS and CAUTIONS carefully. Follow all SAFETY PRECAUTIONS to avoid personal injury or property damage during system operation. ENERPAC cannot be responsible for damage or injury resulting from unsafe product use, lack of maintenance or incorrect product and/or system operation. Contact ENERPAC when in doubt as to the safety precautions and applications.

## TO PROTECT YOUR WARRANTY, USE ONLY ENERPAC HYDRAULIC OIL.

## 2 ATTENTION

You have purchased a single-acting, spring return T-Slot Pull Cylinder. Carefully read all the instructions and precautions regarding their operation.

## 3 GENERAL SAFETY ISSUES

Failure to comply with following cautions and warnings could cause equipment damage or personal injury.

WARNING: To avoid personal injury and possible equipment damage make sure all hydraulic components withstand the maximum pressure of 350 bar.

WARNING: DO NOT OVERLOAD the cylinder. NEVER EXCEED the nominal clamping capacity. Overloading may cause personal injury and equipment damage.

IMPORTANT: Use hydraulic gauges in each hydraulic system to indicate safe operating loads.

SAFETY FIRST: Circuit pressure should not exceed the maximum tolerance value of the lowest pressure component.

For fast operating cycles, use only high-pressure hoses and connections.

Do not exceed piston stroke limits.

Using the piston at end stroke under maximum pressure, puts the cylinder under unnecessary and dangerous strain.

WARNING: Make sure that all system components are protected from external sources of damage, such as excessive heat, flame, moving machine parts, sharp edges and corrosive chemicals.

CAUTION: Avoid sharp bends and kinks in the hose which may cause damage. Also, bends and kinks lead to premature hose failure.

## 4 PRODUCT DESCRIPTION

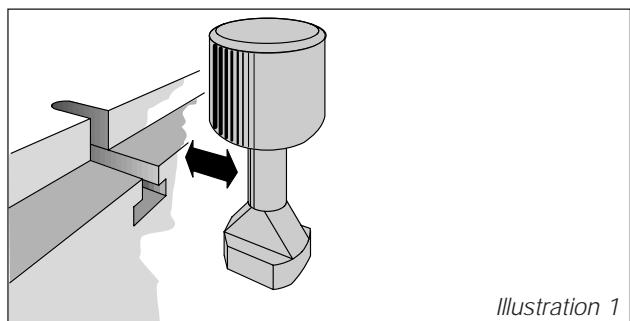

Illustration 1

MHC-50, MHC-70 and MHC-110 T-Slot Pull Cylinders are single-acting, spring return. They have been designed to fit onto dies with T-slots for standard securing with screws.

They may be easily mounted along the T-slots on the die shoes. Depending on the model, these cylinders have a capacity of 44 kN - 68 kN or 110 kN. The dimensions are provided in illustration 2 on page 13. The oilconnections are 1/4" BSP. These cylinders have swivel plates that accurately align the rod.

## 5 APPLICATIONS

**ATTENTION:** Clamping should occur only during the piston stroke, never at the end of the stroke.

**5.1** Make sure that when clamping occurs the piston still has a few millimeters of stroke.

**5.2** Comply with the recommended torque values for the assembly screws.

**5.3** Check the pressure and capacity of the hydraulic circuit. NEVER exceed the recommended values.

## 6 INSTALLATION

**IMPORTANT:** It is mandatory that the operator has a full understanding of all instructions, safety regulations, cautions and warnings, before starting to operate any of this high force tool equipment. In case of doubt, contact ENERPAC.

**6.1** The ENERPAC cylinders are hydraulically powered. Check your particular circuit's characteristic features and pay close attention to the oil pressure and capacity.

**6.2** ATTENTION: An excessive load can damage the cylinder stem or the clamping surface.

**6.3** Make sure the diameter of the hydraulic system hosing is proportionate to its length to prevent loss of system capacity, hampering piston reversal. MHC-cylinders are spring return. 10 x 1.5 dia. steel tubing is recommended.

**IMPORTANT:** Purge the hydraulic system before starting the machine. Air in the circuit causes operational problems. Advance and retract the cylinder several times avoiding pressure build-up. Air removal is complete when the cylinder motion is smooth.

## 7 MAINTENANCE AND SERVICE

Maintenance is required when wear or leakage is noticed. Periodically inspect all components to detect any problem requiring service and maintenance. ENERPAC offers ready-to-use spare parts kits for repair and/or replacements.

See page 14-15 for spare parts list.

- Regularly inspect all components to detect any problem requiring maintenance and service. Replace damaged parts immediately.
- Do not exceed oil temperature above 60 °C.
- Keep all hydraulic components clean.
- Periodically check the hydraulic system for loose connections and leaks.

- Change hydraulic oil in your system as recommended in the pump instruction sheet.

**IMPORTANT:** Hydraulic equipment must only be serviced by a qualified hydraulic technician. For repair service, contact the Authorized ENERPAC Service Center in your area.

## 8 TROUBLESHOOTING

Only qualified hydraulic technicians should service the pump and system components. The trouble-shooting table 8.1 is intended to be used as an aid in determining if a problem exists.

### 8.1 Troubleshooting diagnosis

PROBLEM	POSSIBLE CAUSE
<b>1. Cylinder doesn't move forward</b>	A. Pump release valve open B. No oil in pump reservoir C. Air in the system D. Poorly screwed joint E. Hydraulic circuit blocked
<b>2. Cylinder moves only partially forward</b>	A. Oil level in pump reservoir too low B. Piston cylinder seized up
<b>3. Cylinder jerks forward</b>	A. Air in the circuit B. Piston cylinder seized up
<b>4. Cylinder advances slowly</b>	A. Leaky connections B. Kinked circuit hosing C. Loose joints or connections
<b>5. Cylinder advances but loses pressure</b>	A. Leaky gaskets B. Leaky connections C. Pump malfunction
<b>6. Cylinder leaks oils</b>	A. Worn or damaged piston B. Leaky connections C. Internal grooving
<b>7. Cylinder returns slowly or not at all</b>	A. Pump release valve closed B. Poorly screwed joint C. Blocked circuit D. Oil pump reservoir overfilled E. Cylinder internally or externally damaged F. Diameter of circuit tubing too small for the length
